How to remove / adjust new icons in Strategic Planning Workspace (Australia release)

Guide for controlling the left-side navigation (chrome_toolbar) after the Australia upgrade

Introduction

One of my Client's instances was upgraded to the Australia release. After the upgrade, we discovered several newly introduced route-icons in the Strategic Planning Workspace. These new features may be useful, but we need time to explore and understand them before releasing and guiding end users. Until then, the icons need to be hidden so users are not confused.

Strangely, I did not find any article or post on this topic. As I luckily figured this out, I want to share the solution so others do not have to scratch their heads investigating the same issue.

The left-side navigation in the Workspace is controlled by a single JSON page-property called **chrome_toolbar**.

Steps

1. Navigate to **sys_ux_page_registry.LIST** (UX Application).
2. Open the record for **Strategic Planning Workspace**.
3. In the related list **UX page properties**, locate the property named **chrome_toolbar**.

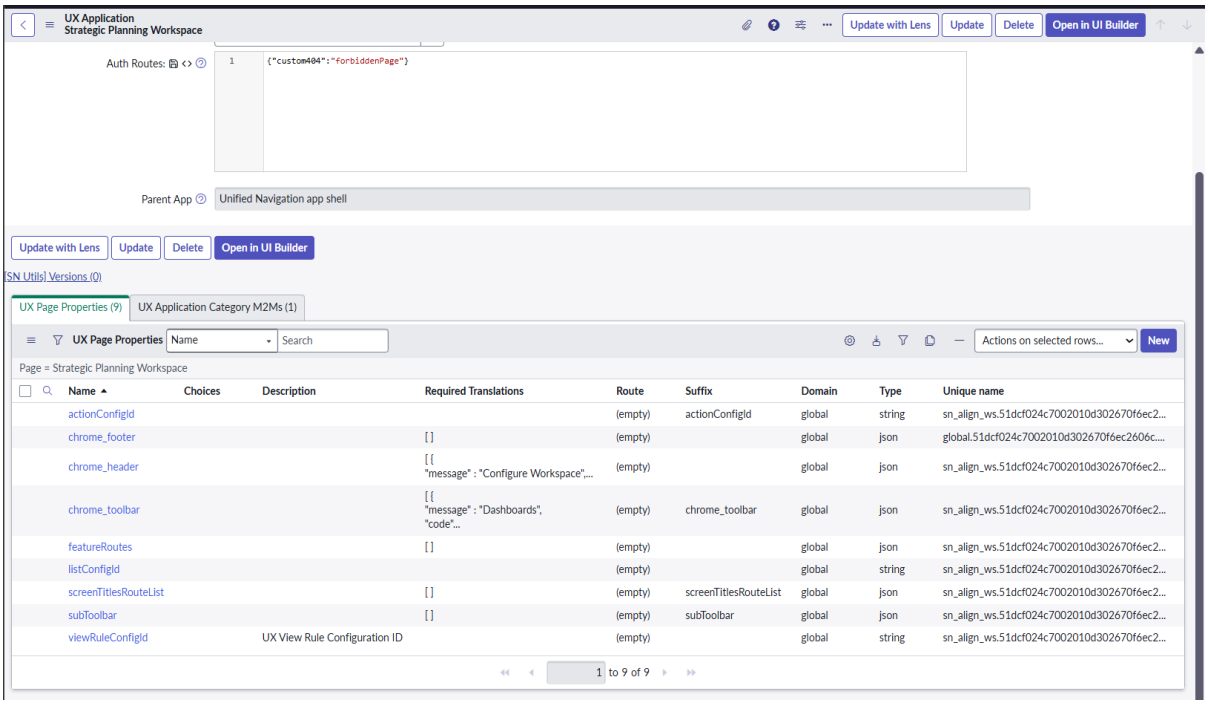

Figure 1 – UX Application "Strategic Planning Workspace" showing the chrome_toolbar page property

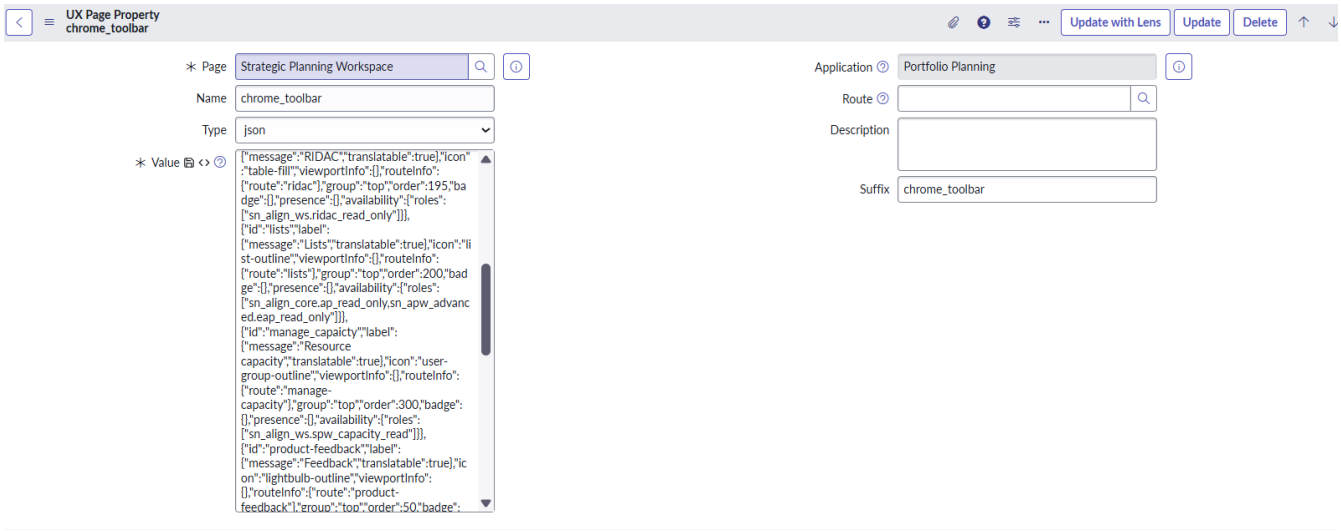

Figure 2 – chrome_toolbar JSON value (list of toolbar items with roles, routes, icons, etc.)

In the Value field you will see a JSON array. Each object represents one icon/route in the left navigation.

Two practical options

Option 1 – Remove the related value completely (not recommended, but possible)

You can delete the entire object that corresponds to the unwanted icon from the JSON array. This permanently removes the entry. Use this only if you are certain the feature will never be needed.

Option 2 – Restrict visibility with a specific role (recommended)

Add (or tighten) the **roles** array inside the relevant toolbar item so that only users who hold a particular role can see the icon. Everyone else will no longer see it in the navigation.

For our case we chose Option 2: keep the new icons available for the admin / exploration team while hiding them from regular end users.

Example – restricting an item by role

Locate the object for the icon you want to hide. Inside its `availability` (or similar) section you will find a `roles` array. Change it to a more restrictive role, for example:

```
"roles": ["sn_align_ws.ridac_read_only"]
    → change to a role that only your admin team holds

or keep existing roles and add a new restrictive one so only those users see the icon.
```

Additional possibilities

Inside the same **chrome_toolbar** JSON you can also:

- Add a completely new custom icon / route
- Re-order icons by changing the `order` property
- Change icons, labels, or groups
- Adjust badge, presence, or availability settings

> **Note:** Always work on a non-production instance first (or take a backup of the original JSON). After saving the property, refresh the Strategic Planning Workspace (or clear cache) to see the change. Because this is a page property, the change is application-scoped and will travel with Update Sets if you capture it correctly.

Hopefully this short guide saves you time the next time new toolbar icons appear after a release upgrade.
